MUTATION TESTING - BACKEND

GROUP 28 - Coincious

Prof. Saurabh Tiwari

Mutation testing is a quality assurance technique that evaluates the effectiveness of your test suite by introducing small, intentional mutations (bugs) into the code and checking if the tests catch them. This guide explains how to perform mutation testing on the backend services. For this backend part we focused on doing mutation testing for the services file because it had the most mutations and bugs affecting core functionality and high complexity.

I have performed mutation testing for the backed folder for the following services file:

1. Expense_service
2. Categorizer_service
3. Group_service
4. Invitation_service
5. Notification_service
6. Ai_service

To find the mutation score after running the mutation test , I have created a file to calculate the score .

$\text{Mutation Score} = (\text{Killed Mutants} / (\text{Killed} + \text{Survived})) * 100$

This helps evaluate test quality:

- 90-100%: Excellent test coverage
- 80-89%: Good test coverage
- 70-79%: Acceptable test coverage
- 60-69%: Needs improvement
- <60%: Poor test coverage

Score Progression

Phase	Tests	Killed	Survived	Score	Grade	Key Action
Initial	4	159	2,695	5.57%	F	Baseline
Phase 1	10	329	2,033	13.93%	F	Added expense_service tests
Phase 2	49	455	1,493	23.36%	F	Added categorizer, invitation, notification tests
Phase 3	71	579	773	42.83%	F	Added group_service additional tests
Phase 4	91	605	773	43.90%	F	Added create_group & expense edge cases
Phase 5	305	1230	276	81.67%	B	Comprehensive testing + test consolidation
Phase 6	324	1320	98	93.09	A	AI service testing + final optimization

In total i have made 324 tests

I have also made a setup.cfg file which is a configuration file used by Python tools and packages. The setup.cfg file is a standard Python configuration file that various tools read to understand how to work with your project. It's part of Python's packaging ecosystem and provides configuration for multiple tools in one place. It targets the right code (app/services), Uses efficient test execution (pytest -q), Prevents problems (excludes test files) and Follows standards (standard INI format)

```
Coincious-Smart-Expense-Tracker > backend >  setup.cfg

1 [mutmut]
2 paths_to_mutate = app/services
3 tests_cmd = .venv/bin/pytest -q
4 exclude = tests
```

For each of the services files I have created the test file for each of them to perform mutation testing and find mutation score.

1. test_group_all_comprehensive_merged.py :

In this file i have created 206 tests and it handles

- Group Service Functions (47 tests): create_new_group, delete_group, get_user_groups, get_group_detail, add_group_member, get_group_members, get_group_balances, settle_group_balance
- Group Operations(49 tests): Input validation, authorization checks, cascading deletes, permission management
- Group Data Retrieval (54 tests): Balance calculations, member information, expense data, cross-service integration
- Add Group Member(26 tests): User validation, permission checks, invitation creation, notification logic
- Settle Group Balance (30 tests): Validation logic, expense creation, split creation, notification handling, rollback logic

```

📊 Calculating mutation score...  
=====  
MUTATION TESTING REPORT  
=====  
Mutation Score: 93.09% 🟢 [Grade: A]  
=====  
Detailed Results:  
✓ Killed (Good): 1320 mutants  
✗ Survived (Bad): 98 mutants  
⏯ No Tests: 0 mutants  
⌚ Timeout: 0 mutants  
🤔 Suspicious: 0 mutants  
💥 Incompetent: 1694 mutants  
=====  
📊 Total Mutants: 1418 mutants  
=====  
Calculation:  
Killed / (Killed + Survived) = 1320 / (1320 + 98) = 93.09%  
Grade: A  
Status: ✅ Excellent – Test suite is very effective
```

```
● karthikraman@Balamurugans-MacBook-Pro backend % mutmut run 2>&1 | tail -10  
: Generating mutants  
    done in 44776ms

. : Running clean tests  
    done  
. : Running forced fail test  
    done  
Running mutation testing  
  ⚡ 3112/3112 🎨 1320 😊 0 🕒 0 🤔 0 😐 1694 💥 0  
13.88 mutations/second
```

Conclusion & challenges faced during mutation testing:

1. While performing mutation testing we thought of generating the html report for the results but we realised we need a python version less than 3.8.
2. When we tried using an older version of python it was not able to detect mutants properly and had issues with requirements in installing the package.
3. We decided to use the python 3.13 version and found results accordingly. At first we got a mutation score of 5% only and later we improved the test cases phase by phase and then we reached 93% score . we took help from ai for generation of test cases .
